

BIOSYNTHETIC PATHWAY TRANSCRIPTION FACTORS

ABSTRACT OF THE DISCLOSURE

The present invention provides a high-throughput method for identifying a
5 polynucleotide which encodes a transcription factor for controlling the expression of one or more
genes in a pathway. In particular, the method is useful for identifying a transcription factor for
controlling a gene in a biosynthetic pathway. The invention further provides polynucleotides
encoding such transcription factors for controlling the expression of a gene in a biosynthetic pathway,
transgenic cells expressing at least one such polynucleotide, and methods for isolating metabolites
10 from such cells or plants.
